EDUCATION

Skidmore College, Saratoga Springs, NY *Anticipated: May 2026*
Major: Computer Science | Minor: Economics *Major GPA: 3.8 | Overall GPA: 3.4*
Programming Languages: Python, Java, C, SQL, JS, TS **Tools**: AWS, n8n, Git, NetBox, KVM/QEMU
Technical Skills TCP/IP · VLANs, DHCP & DNS · network segmentation & traffic analysis · Linux systems administration · RAID storage · cryptography & threat modeling · phishing detection & OSINT · privilege management & access control · data structures & algorithm analysis · REST API integration · scripting & automation

RELEVANT EXPERIENCE

Automation Engineering Intern, Butter AI (startup) Feb 2026 – Present

- Engineered a 4-stage ETL pipeline in n8n that ingests ~333 articles/week across 12 RSS feeds, routes content through an LLM relevance filter, and scrapes approved sources — reducing manual research overhead to near-zero
- Built an agentic process that uses AI to score articles, ranking them from highest to lowest priority using API calls, cutting unnecessary Firecrawl and OpenAI costs by filtering out unnecessary content early
- Integrated Firecrawl and OpenAI APIs to perform structured a complete text extraction from restaurant industry web sources, producing clean, highly relevant content summaries ready for marketing use
- Eliminated 15+ hours/week of manual content work by building an end-to-end automated pipeline covering research, writing, image generation, and publishing — freeing the team entirely from recurring content production

Network Analyst Intern, Skidmore College *Summer 2025*

- Monitored and maintained campus-wide network infrastructure — switches, routers, and wireless access points — ensuring secure and reliable connectivity across academic and administrative buildings serving thousands of users
- Configured NetBox as the authoritative source for network documentation and asset tracking, streamlining visibility into device inventory and speeding up troubleshooting of connectivity issues
- Configured VLANs, DHCP, and DNS across segmented campus subnets, deepening hands-on proficiency in network segmentation and access control policy

Systems Administrator Assistant, Skidmore College *Sep 2025 - Present*

- Installed and configured Ubuntu Server on a Dell Precision 5820 workstation with a RAID 1 storage array, preparing the system for virtualization hosting using KVM/QEMU/libvirt
- Designing and implementing a Multi-Factor Authentication (MFA) system that integrates password and verification token layers to secure Linux user logins

Cybersecurity Researcher, Phishing Research, Skidmore College *Sep 2024 – Present*

- Conducted in-depth research into phishing detection models — analyzing deceptive techniques, evolving attacker strategies, and system vulnerabilities — resulting in a 15% measurable improvement in phishing threat identification and mitigation
- Designed and implemented a custom phishing detection system research findings into a working tool evaluated against real-world threat scenarios

AI Community Assistant, DIS Copenhagen *Jan 2025 – May 2025*

- Facilitated weekly AI-focused study sessions with 5 students and faculty on ethical and effective AI use in academics

PROJECTS

- ***NBA Game Outcome Predictor***: Feedforward neural network for binary classification of NBA game
  - Built and compared three model architectures (feedforward neural net, logistic regression, and RNN) to predict NBA game outcomes across 2021–2024 seasons, achieving 7.0/10 average correct predictions per 10-game stretch and 75.57% accuracy on a Celtics-specific RNN with rolling win percentages — well above the 66% baseline of picking the higher win-percentage team
  - Full write-up published on Medium
- ***Steam Horror Clustering***: Big Data ML pipeline across 4,600+ games
  - Engineered a full data collection pipeline using the Steam Store API, SteamSpy API, and BeautifulSoup to extract and enrich metadata for 4,600+ horror games, constructing a 459-dimension feature matrix
  - Applied K-Means clustering with PCA and t-SNE to surface hidden groupings — revealing distinct clusters like Strategy, Roguelike, and Platformer horror positively correlated with playtime and review score; built a recommender system on top that takes a user's input game, identifies its cluster, and returns similar titles based on shared gameplay tags, genre, and market features
- ***Crubtale:*** Stardew Valley–inspired farming and life-simulation mod for Hytale
  - Building modular gameplay systems — crop growth with seasonal cycles, NPC interaction logic, and event-driven gameplay loops — using Hytale's scripting and modding framework
  - Designing a state-driven crop growth system with inventory management and data-driven NPC behavior, applying software design principles including state machines and event-driven architecture
